## In the Claims:

Please cancel claims 2 and 21-26. Please add new claims 27-33. The claims are as follows:

1. (Original) A method of forming a security enclosure, comprising:

providing an electronic assembly;

enclosing the assembly in a tamper respondent wrap, such that the wrap forms fold lines at a first and second end of the assembly;

placing the enclosed assembly in a fixture, wherein the fixture comprises a base upon which the assembly rests, a first stationary arm mounted on the base holding the fold lines at the first end of the assembly, a second arm slidably mounted on the base, and a traversing mechanism to bias the second arm toward the fold lines at the second end of the assembly; and heating the enclosed assembly.

- 2. (Canceled)
- 3. (Previously presented) The method of claim 1, further comprising heating the enclosed assembly at a temperature of 40-90 °C.
- 4. (Previously presented) The method of claim 1, further comprising heating the enclosed assembly for 1 hour.
- 5. (Original) The method of claim 1, wherein the fixture comprises a clamping device.

- 6. (Original) The method of claim 1, wherein the tamper respondent wrap comprises a flexible material having tamper respondent detection devices.
- 7. (Original) The method of claim 1, wherein the tamper respondent wrap comprises:

at least one pierce and laser respondent layer;

a delamination respondent layer; and

an adhesive between the pierce and laser respondent layer and the delamination respondent layer.

- 8. (Original) The method of claim 7, wherein the pierce and laser respondent layer and the delamination respondent layer comprise a plurality of ink lines on at least one side of the pierce and laser respondent layer and the delamination respondent layer.
- 9. (Original) The method of claim 1, wherein the electronic assembly comprises a cryptographic processor.
- 10. (Original) The method of claim 9, wherein the cryptographic processor comprises a printed circuit board, having mounted thereon:

an encryption module to carry secured sensitive information;

a memory to store a key necessary to access the information;

an erase circuit to crase the information in the encryption module in the event the tamper respondent wrap is breached; and

an enclosure monitor to activate the erase circuit in the event a breach is detected.

11. (Original) A method of producing a tamper respondent enclosure, comprising:

enclosing a cryptographic processor in a tumper respondent sheet, wherein an adhesive material secures the enclosure;

holding the enclosed cryptographic processor such that the adhesive material remains intact; and

applying heat to the enclosed cryptographic processor to strengthen the adhesive material.

- 12. (Original) The method of claim 11, further including holding the enclosed cryptographic processor in a clamping device.
- 13. (Previously presented) The method of claim 11, further including applying heat at a temperature of 60 °C.
- 14. (Previously presented) The method of claim 11, further including applying heat at a temperature of 50-70 °C.
- 15. (Original) A method of forming a security enclosure, comprising:

providing a circuit card;

enclosing the card in a tamper respondent cloth, wherein an adhesive secures fold lines of the cloth;

holding the fold lines of the cloth to maintain adhesive contact; and heating the enclosed card.

- 16. (Original) The method of claim 15, further comprising holding the cloth in a clamping device to maintain the adhesive contact.
- 17. (Original) The method of claim 16, wherein the clamping device comprises:
  - a base upon which a security enclosure rests;
- a first stationary arm mounted on the base, which holds a first end of the security enclosure;
  - a second arm slidably mounted on the base; and
- a traversing mechanism to bias the second arm toward a second end of the security enclosure.
- 18. (Previously presented) The method of claim 15, further comprising heating the enclosed card at 60 °C for 1 hour.
- 19. (Original) The method of claim 15, further comprising curing the adhesive.
- 20. (Original) The method of claim 15, wherein the circuit card comprises a cryptographic processor.

21-26. (Canceled)

27. (New) A security enclosure, comprising:

an electronic assembly;

a tamper respondent wrap, such that the wrap forms fold lines at a first and second end of the assembly, said wrap enclosing the electronic assembly; and

a fixture in which the enclosed assembly is placed, wherein the fixture comprises a base upon which the assembly rests, a first stationary arm mounted on the base holding the fold lines at the first end of the assembly, a second arm slidably mounted on the base, and a traversing mechanism to bias the second arm toward the fold lines at the second end of the assembly.

- 28. (New) The security enclosure of claim 27, wherein the fixture comprises a clamping device.
- 29. (New) The security enclosure of claim 27, wherein the tamper respondent wrap comprises a flexible material having tamper respondent detection devices.
- 30. (New) The security enclosure of claim 27, wherein the tamper respondent wrap comprises:
  - at least one pierce and laser respondent layer;
  - a delamination respondent layer; and

an adhesive between the pierce and laser respondent layer and the delamination respondent layer.

- 31. (New) The security enclosure of claim 30, wherein the pierce and laser respondent layer and the delamination respondent layer comprise a plurality of ink lines on at least one side of the pierce and laser respondent layer and the delamination respondent layer.
- 32. (New) The security enclosure of claim 27, wherein the electronic assembly comprises a cryptographic processor.
- 33. (New) The security enclosure of claim 32, wherein the cryptographic processor comprises a printed circuit board, having mounted thereon:

an encryption module to carry secured sensitive information;

a memory to store a key necessary to access the information;

an erase circuit to crase the information in the encryption module in the event the tamper respondent wrap is breached; and

an enclosure monitor to activate the erase circuit in the event a breach is detected.
